

MID-TERM EXAMINATION

Subject: python

Paper: Set A | Duration: 30 Minutes | Max Marks: 50 | Date: 22-02-2026

Total Questions: 1 | Answer all questions.

Section 1: MCQ (1 Questions - 1 Marks)

Q1. [1 marks]

Given the following Python code:

```
```python
class NonDataDescriptor:
 def __get__(self, instance, owner):
 return "NonDataDescriptor invoked"

class DataDescriptor:
 def __get__(self, instance, owner):
 return "DataDescriptor invoked"
 def __set__(self, instance, value):
 # The presence of __set__ defines it as a data descriptor.
 # Its implementation here does not store the value,
 # but the method's existence is crucial.
 pass

class MyClass:
 ndd = NonDataDescriptor()
 dd = DataDescriptor()

obj = MyClass()

print(obj.ndd) # Statement 1
obj.ndd = "instance_value_ndd"
print(obj.ndd) # Statement 2

print(obj.dd) # Statement 3
obj.dd = "instance_value_dd" # This invokes DataDescriptor.__set__
print(obj.dd) # Statement 4
```
```

What is the expected output for `Statement 1`, `Statement 2`, `Statement 3`, and `Statement 4` in sequence?

A)
NonDataDescriptor invoked
instance_value_ndd
DataDescriptor invoked
DataDescriptor invoked

B)
NonDataDescriptor invoked
NonDataDescriptor invoked
DataDescriptor invoked

DataDescriptor invoked

C)

NonDataDescriptor invoked

instance_value_ndd

DataDescriptor invoked

instance_value_dd

D)

NonDataDescriptor invoked

NonDataDescriptor invoked

DataDescriptor invoked

instance_value_dd
